## ERRATA

Ghana Statistical Service (GSS), Ghana Health Service (GHS), and ICF International. 2015. Ghana Demographic and Health Survey 2014. Rockville, Maryland, USA: GSS, GHS, and ICF International.

February 2016:

There was a refinement to the weight variable to be used when calculating early childhood learning and development statistics. Because early child education questions HHQ32-HHQ41 were asked of only one randomly selected child age 4-15 per household, a special weight is needed when calculating estimates from those questions. The weight variable has been adjusted, a new data file released, and affected tables re-run. Tables $10.12-10.16$ and accompanying text have been corrected in the electronic version of the report on the website.

The corrected information is shown below; yellow highlighted strikethrough font indicates error, red font indicates correct text and data.

## Chapter 10 CHILD HEALTH AND EARLY DEVELOPMENT

## Page 125

## Key Findings box

- Four percent of children under age 5 showed symptoms of acute respiratory infection in the two weeks before the survey; and about one half of these newborns children were taken to a health facility or provider for advice or treatment.
- About Half of children age 4-15 were engaged by an adult household member in more than four activities that support learning during the seven days preceding the survey; children living in the richest households were almost twice as likely as those living in the poorest households to engage in these activities.
- Nearly 6 in 10 household respondents parents/caretakers want their children age 4-15 to be taught in both English and a local language while, about 3 in 10 prefer their children to be taught in English only.
- The majority of children age 4-15 years who attended school in the 2014-2015 school year walked to school ( 8284 percent) and nearly one-third spend more than 20 minutes to get to school.

## Pages 144 to 151

### 10.9.1 Support for Learning

Corrections begin in the fourth paragraph of page 144.

Thirty-five percent of the children engaged in one to three activities with an adult household members in the past week. More than Half of children age 4-15 (51 50 percent) were engaged by an adult household member in four or more activities that support learning. Generally, children in urban areas ( 56 percent) are more likely than their rural counterparts (46 45 percent) to engage in four or more learning activities with household members. Signifieant-Substantial differentials by region and socio-economic status are also observed:
engagement of household members in four or more activities with children is highest in Western, Greater Accra, Eastern, and Central, and Western regions (55-57 54-57 percent) and lowest in Upper East Northern region (38 percent). While 6768 percent of children living in the richest households get engaged in four or more activities with household members, the proportion of those living in the poorest households is 36 percent. Engagement of household members in activities with children increases with parents'/caretakers' education and increasing wealth. Whereas the mean number of activities for children whose parents have a secondary or higher education is five, that of children whose parents have no education is three.

Some of the activities, such as helping with homework, talking to the child's teacher about progress, participating in parent-teacher and school management committee activities, and providing the child with a lantern, torch, or lamp, only apply to children currently in school. Data in Table 10.12 on activities that promote learning can be recalculated for only those children age 4-15 who attended school during the 2014-2015 school year. In that case, the proportion of children engaged by an adult household member in four or more activities to support learning increased from 5450 percent among all children to 5857 percent among children of the same age attending school (data not shown). However, the percentage of children engaged in one to three activities with an adult household member in the past week is almost the same for all children age 4-15 ( 35 percent) and for those children age 4-15 who attended school during the 2014-2015 school year ( 34 percent, data not shown). The mean number of activities that household adult members engage in with children is about four in both groups of children regardless of whether they attended school (data not shown).

${ }^{1}$ Activities include helping with homework, buying or borrowing books to read, taking child to library, taking child to a reading event, talking to child's teacher about child's learning progress, participating in parent teacher association, participating in a school management committee, regularly reading to the child, encouraging the child to read, communicating high expectations to the child, providing the child with a lantern/torch/lamp, relieving the child of some household chores, or other similar activities.

### 10.9.2 Reading, Book Ownership, and Textbook and Reading Materials

The importance of being able to read is widely accepted. The ability to read is associated with improved quality of life, not only for the individual, but in the case of adults, also for their families and communities. Students who learn to read within the first few years of school have a greater chance of succeeding in and completing primary school.

There is evidence that children benefit most from regular reading that includes sensitive, responsive and language-rich interactional routines (Dickinson et al. 2012). As parents read with children, they have the opportunity for frequent, sensitively tuned, language-rich interactions that draw children into conversations about books, the world, language, and concepts. Allocating time to practice reading is an important way that
parents and other community members can assist with building a child's reading skills. It is important to note that the most fundamental issue relating related to the impact of reading on children is reading frequency.

Table 10.13 provides information about the frequency that household members read to children age 4-15 years in the household. Overall, about one-fifth ( 2221 percent) of children age 4-15 are living in households where a member reads to them a few times a week. About 17 Sixteen percent of children are read by a household member once a week. Fifty-six Fifty-eight percent of the children had no member of the household read to them.

The proportion of urban children who got a member of the household read to them a few times a week is higher than their rural counterparts ( 29 percent and 17 percent, respectively) ( 28 percent and 16 percent, respectively). Regional differences are observed in the proportion of children who live in households where someone reads to them a few times a week, ranging from 3429 percent in Greater Accra to 1410 percent in Upper West. This percentage increases substantially with parents'/caretakers' education and household wealth.

Table 10.13 also presents information about the availability of children's books and reading materials in the household. Overall, 6261 percent of the children age 4-15 years live in households that had between 1 and 10 children's books and reading materials in the house, 11 percent have 11 to 20 books, and 5 percent had 21 or more books.

However, about one-fifth of children lived in households without any children's books and reading materials. The percentage of children age 4-15 living in households without any children's books and reading materials is highest in Upper West (45 percent) and lowest in Upper East, Central, and Ashanti (14, 15, and 16 percent, respectively).

By urban-rural residence, children in urban areas are more likely than those in rural areas to own books and reading materials and to own more of them. Substantial differences are observed by parent's/caretaker's education, wealth and ownership of books. Nearly one-third of children whose parents have no education (31 percent) have no children's books and reading material at the house compared with 7 percent of children whose parents have a secondary or higher education. A similar pattern is observed by household wealth.

Note: Total includes 1 child for whom information on mother's/father's/caretaker's education is missing.

The frequency with which children bring their reading materials home can widen their reading experience. Parents have a vested interest in their child's reading as it holds the key to other areas of learning and life. It is possible to improve student outcomes with materials that support and build students’ emerging literacy skills. The more opportunities children have to read stories and other teaching and learning materials, the quicker they will learn to read. Even though the school will take steps to help the children to develop the skills needed to become a confident reader, parents play an important part by supporting and encouraging their children.

Exposure to books in early years plays an essential role in children's emerging ability to interpret the meanings of words and provides the child with greater understanding of the nature of the print. The presence of books is important for later school performance and IQ scores. Evidence suggests that the simple act of providing books to families can increase the frequency of reading and may have beneficial effects on interactions around books (Dickinson et al. 2012). It is possible to improve student outcomes with materials that support and build
students' emerging literacy skills. The more opportunities children have to read stories and other teaching and learning materials, the quicker they will learn to read.

Table 10.14 provides information about how often children bring their textbooks and other reading materials home from school. The data show that 1817 percent of children age $4-15$ who were attending school always brought reading materials home, and 17 percent of the children brought reading materials home often and 36 percent sometimes. Almost 3 in 10 children ( 29 percent) never brought any reading material home from school.

Irrespective of frequency, yYounger children (age 4-6) are less likely than the older children (13-15 years) to always bring reading materials home. Urban and female children are more likely to bring reading materials home from school frequently than rural and male children. Regional disparities exist with respect to the frequency with which children bring home reading materials. Children in Greater Accra region ( 31 percent) (29 percent) are the most likely to always bring home reading materials, whereas children in Upper West are the least likely to do so (4 percent). Children whose parents have a secondary or higher education and those who live in the wealthiest households are generally more likely than other subgroups to bring home reading materials frequently.

### 10.9.3 Language for Education

The opportunity for children to use their local language has implications for their educational and cognitive development. It is argued that the use of a language other than the child's local language in education threatens their academic development and deprives them of many social advantages. However, formulating and implementing language policies of education in Ghana especially at the lower primary level has been a contentious issue at social and political levels. Parents have expressed different opinions regarding the language of instruction to be used in primary schools in the country. One school of thought suggests the use of English only as the language of instruction, while others have proposed the use of the local languages and yet some think a combination of both the English and local languages will suffice.

In Ghana, the language of instruction at lower primary school level is English combined with the local language, while that of the upper primary is English. For those who propose the use of local languages, using the mother tongue in early education will lead to a better understanding of the curriculum content and to a more positive attitude towards school. However, opponents to this idea think that it will be very costly and also be impossible to draw up a uniform code of instruction as there are more than 40 local languages in the country.

Table 10.15 shows that for 5856 percent of children age 4-15, household respondents-parents/caretakers want their children to be taught in both English and a local language, for 3536 percent of children household respondents parents/caretakers want them to be taught in English only, and for only 6 percent household respondents parents/caretakers want children to be taught in a local language only.

The percentage of children living in households where household respendents parents/caretakers want them to be taught in both English and a local language is slightly higher almost the same in urban than and in rural areas (59 57 percent and 5756 percent, respectively). 'Household respondents’ Parents'/caretakers' preference for teaching children in English and a local language is highest among children living in Upper West and Volta regions (70 66-68 percent), children whose parents have a secondary or higher primary or more education ( $6057-58$ percent), and those living in the wealthiest households ( 6260 percent).

### 10.9.4 Travel to School

Being able to move from home to school with ease is important for the child. Each day during the school term pupils and their parents travel from home to school in the morning and make the return trip later in the day. Many pupils living close to school walk, with those living farther away travelling mainly by bus or car.

Table 10.16 shows that the majority of children age 4-15 years who attended school in the 2014-2015 school year ( $82-84$ percent) walked to school, 1513 percent of the children commuted to school by bus or car, and 2 percent went to school on bicycle. As expected, Younger children age 4-6 years are slightly less likely to walk to school than older children ( 7881 percent compared with 83-84 85-86 percent), and more likely to go to school by bus or car (17 percent of children age 4-6 versus 12-13 percent of older children). Similarly, Older children age 13-15 are slightly more likely than younger children age 4-6 to go to school by bicycle ( 3 percent and 1 percent, respectively). To the contrary, younger children age 4-6 are more likely than older children age 13-15 to go to school by bus or car ( 19 percent versus 13 percent).

In terms of residence, nearly 9 in 10-90 percent of children in rural areas and more than 7 in 1077 percent of children in urban areas went to school on foot. Children in Upper West and Northern regions (94-95 percent) are the most likely to walk to school and those in Ashanti and Greater Accra ( $7375-76$ percent) are the least likely to do so.

Table 10.16 also shows that children whose parents/caretakers have no education are more likely than those whose parents/caretakers have a secondary or higher education to walk to school (93 and 6394 and 62 percent, respectively). Similarly, the percentage who walk to school is highest among children from the poorest households ( 95 percent) and lowest among those living in the wealthiest households (58 59 percent).

The distance between home and school, and the ease with which pupils can access transport to school, often affects a child's ability to attend school regularly. A child who is already tired before beginning classroom activities will find it difficult to comprehend the learning activities. Data show that 68 percent of school children age 4-15 travel for less than 20 minutes to get to school. About one-third spend more than 20 minutes to get to school: 24 percent spend 21-40 minutes, and 8 percent spend more than 40 minutes.

Generally, older children spend a longer time to get to school than younger children. Three-quarters of school children in Brong Ahafo ( 7577 percent) traveled to school for less than 20 minutes compared with about half ( 54 percent) of children in Upper West.

Table 10.16 Travel to school
Percent distribution of children age 4-15 who attended school in the 2014-2015 school year by the usual mode they get to school and the time it takes to get to school, according to background characteristics, Ghana 2014
